Main Points from Peter:

- Make sure to comment excessively on our pull requests so if we have an issue in the future we can look back and understand where and what errors were made
- In the following week we should come up with a concrete plan about how to begin coding our new features - and then implement them.
- Workbooks have more information on how to create a good Readme but the scores are only given out on Monday - so our score from last Monday isn't reflective of our current Readme which more or less has everything it needs at this point.
- We will be looking more at project structure next week, but for now make sure to not push any APi keys etc.
- Make sure **everything** is being done on the dev branch at the moment

.gitignore clarification:

- You can have gitignores at every level of the project, but it is probably cleaner to have one .gitignore file at the top level that takes care of all the unwanted files such as:
    - Keys
    - Hidden variables
    - Unnecessary build files
    - Ask yourself "Does this file need to be in the repository?" if not then add it to the .gitignore
    - If no team members coded a file, it can probably be excluded

Issues That Arose:

- As far as structure goes we cannot really restructure anything without consulting the client and other team.
- Our project is in an old version of Flutter. If we have plans to create an Android or IOS app, this may become an issue. However, upgrading versions would create massive problems which both our Team and Team 1 would have to fix in the same way to avoid additional merge conflicts.
